

## Vitae Pharmaceuticals highlights VTP-27999 data in two late breaker poster presentations at the American Society of Nephrology's Kidney Week 2011

November 11, 2011 9:02 AM ET

Fort Washington, PA, November 11, 2011 -- Vitae Pharmaceuticals today announced results from the Company's early stage clinical program for VTP-27999, a novel, potent and selective renin inhibitor. Data from two separate studies highlight the potential for VTP-27999 to offer a significant clinical benefit to patients living with chronic kidney disease. The data will be presented at Kidney Week 2011, the annual meeting of the American Society of Nephrology (ASN) being held in Philadelphia, PA from November 8-13, 2011.

Clinical findings from the Phase 1b multiple ascending dose trial will be presented in a poster presentation titled, "VTP-27999: A Novel Direct Renin Inhibitor with Potential for Superior Renal Protection in Diabetic Nephropathy." The Phase I study demonstrated VTP-27999 was safe and well-tolerated, and significantly reduced the activity of the renin-angiotensin-aldosterone system (RAAS) in the kidney to a greater extent than any currently available therapy. Overactivity of the RAAS pathway in the kidney is considered to play a central role in the progression of chronic kidney disease (CKD), particularly in diabetes.

In a second poster presentation titled, "VTP-27999 Increases Renal Plasma Flow More Than Aliskiren," Harvard University researchers reported that three dose levels of VTP-27999 used in a separate Phase I study had a similar or greater effect in increasing renal plasma flow than the maximum approved clinical dose of aliskiren. Renal plasma flow (RPF) is a biomarker of renal vascular function, and drugs that increase RPF slow the progression of CKD.

"We are very pleased with the results of the Phase 1 program. These findings are consistent with our preclinical, *in vivo* research and confirm the potential for improved renal protection with VTP-27999. In addition, these studies have continued to demonstrate the compound is well-tolerated, with pharmacokinetic data supporting once-daily oral dosing," stated Vitae's Chief Scientific Officer, Richard E. Gregg, M.D.

Vitae President and Chief Executive Officer Jeffrey Hatfield said, "Based on these early results we believe VTP-27999 has the potential to make a real difference in the lives of patients suffering from chronic kidney disease. There is a high unmet medical need in chronic kidney disease which is growing in large part due to the rapidly rising incidence of diabetes around the globe. We are excited to be rapidly advancing VTP-27999 and expect to initiate our Phase 2b study in early 2012."

### About the RAAS Pathway and Chronic Kidney Disease

Renin is the first and rate-limiting step in the RAAS pathway, the primary pathway for regulating renal hemodynamics. Over-activation of the RAAS system is directly linked to the pathophysiology of chronic kidney disease. Drugs that directly inhibit renin and more effectively block the RAAS pathway are expected to offer improved kidney protection and improved patient outcomes.

The prevalence of chronic kidney disease has risen more than 25% over the last decade. Current treatments for diabetic CKD focus on controlling diet and glucose levels with oral drugs and insulin, and blood pressure through anti-hypertensive drugs. While these approaches can slow the development of CKD, patients still progress to end-stage renal disease (ESRD), which is life-threatening and requires aggressive, invasive therapy including hemodialysis and renal transplantation. VTP-27999 has been developed specifically for its direct effects in the kidney to alter the course of CKD.

### About Vitae Pharmaceuticals

Vitae Pharmaceuticals is a clinical-stage biopharmaceutical company discovering and developing a portfolio of novel, small molecule, best-in-class compounds that address important disease areas, including: chronic kidney disease, diabetes, Alzheimer's disease and atherosclerosis. Vitae's lead compound, VTP-27999, is a wholly owned,

novel, potent and selective renin inhibitor offering the potential for superior renal protection in patients suffering from chronic kidney disease. The compound is expected to enter Phase 2b in early 2012.

Vitae is expert in structure-based drug discovery and combines a proprietary technical platform with the experience and insight of world class scientists to advance best-in-class compounds for high value, hard-to-target drug targets. Vitae's proprietary, discovery platform has clear advantages in creating and analyzing novel drug candidates that meet pre-defined physicochemical and biochemical characteristics. The accuracy and speed of this system has enabled Vitae to solve challenging targets in multiple therapeutic areas – discovering and advancing attractive compounds in a rapid and highly capital efficient manner. Vitae Pharmaceuticals is financed by leading corporate and venture capital investors; its last venture round was in 2004. Vitae's 45 scientists are located in Fort Washington, Pennsylvania.
